

AIR FILTERS

ECOTIP produces air filters for engines which are widely used on trucks, buses, agricultural machinery, construction equipment and machinery as well as heavy duty engines. ECOFIL® air filters are produced to very high quality by using DPS and 2DPS system.

RADIAL SEAL AIR FILTERS

Special micro cell polyurethane is used to produce radial seal filters. High performance is achieved in extreme conditions by using DPS and 2DPS pleating system.

WHAT IS DPS

DPS is a pleating system which is designed to have best efficiency from the filtration. Using this system provides equal space between the pleats as well as allowing even air flow through the filter. Gaps between the pleats do not change under any extreme conditions and emission surface does not decrease in a short period of time. Thus, a regular air flow occurs and the long lasting efficiency of the filters are provided.
